1.1.1 Supported Platforms for GT-SUITE v7.1 and the License Server

It is expected that all PC and Linux platforms from [v7.0 supported list](#) will be supported in v7.1. The v7.0 UNIX platforms are supported as a license server only. CFD coupling from these UNIX platforms will be allowed to a currently supported PC/Linux platform.

1.1.2 User Routine Compiler Upgrade Required for v7.1

The compiler which is used while compiling custom user routines will need to be Intel 11 or greater in v7.1. This unfortunate event is due to many recent issues arising from mixing versions (and even subversions) of the Intel compiler used build the solver and that used to build the user routine.

While this may be an inconvenience at first, it will make the user routines more robust and improve the ease of use. If you will not be able to upgrade to Intel 11 while upgrading to GT-SUITE v7.1 (circa the end of 2010), please email support@gtisoft.com and we will consider this in our decision.
